

Using Micromodels to Understand the Flow of Two Fluids

Caroline Webb

Working with Professor Pyrak-Nolte and Chris
Petrovich

Fluid Dynamics

- Darcy's Law works for one fluid flowing through porous media, but not two

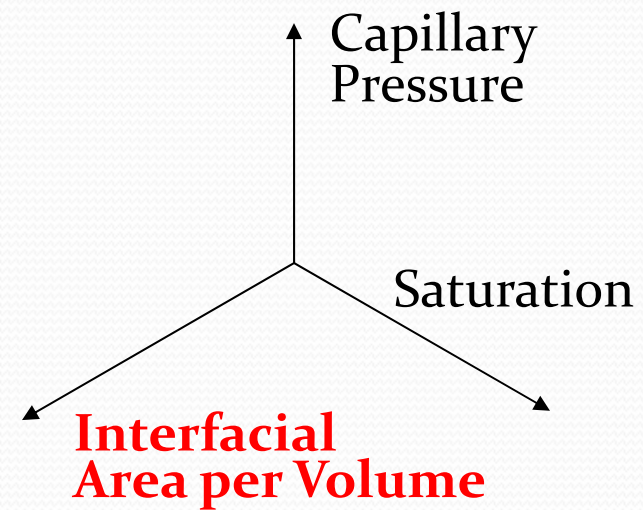

$$Q = \frac{-\kappa A (P_b - P_a)}{\mu L}$$

- Interfacial Area per Volume (IAV)
- Useful for ground water contamination, chemical mixing, oil

Capillary Pressure - Saturation Hysteresis

Diagrams from Pyrak-Nolte

Past Experiments

- Cheng, Pyrak-Nolte, et al found that IAV works as a state variable
- IAV is a function of Pressure and Saturation
- Some have questioned whether surface tension, and not IAV could predict the flow

“Linking Pressure and Saturation Through Interfacial Areas in Porous Media”, Cheng et al, 2004

Purpose

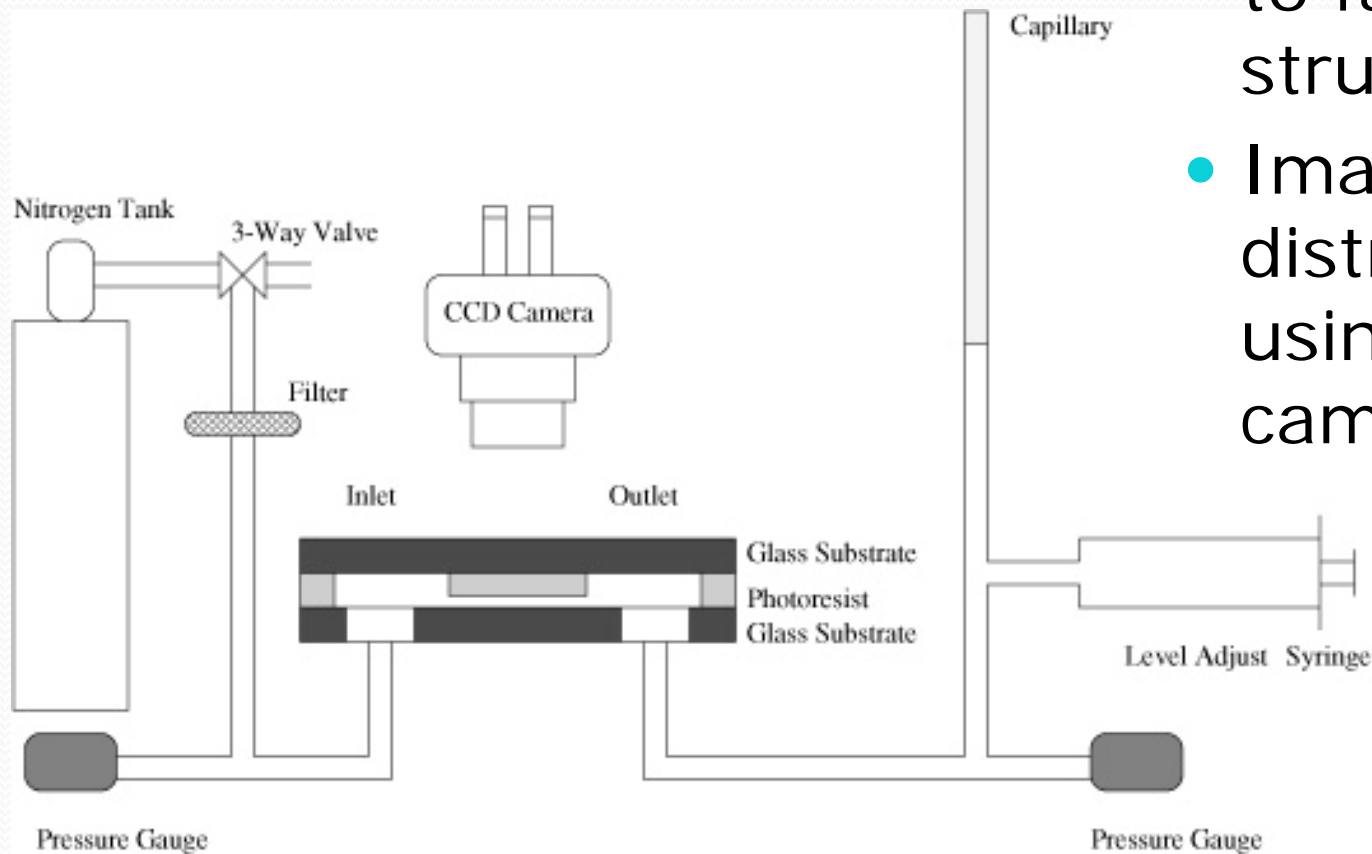

- Compare the effects of surface tension on fluid flow, using different fluids with Nitrogen gas
 - 1. Decane --23.83mN/m
 - 2. Glycerine --64.00mN/m
 - 3. Olive Oil --40mN/m
 - 4. Water --72mN/m
- Wetting and Non-wetting

Micromodels

- Use Photoresist to fabricate pore structures
- Image fluid distributions using CCD camera

Making Micromodels

- Clean slides
- Coat with photoresist and bake
- Expose patterns
- Develop
- Seal
- 105 slides fabricated

Cleaning Slides

- Dust
- Alcohol
- Acetone
- HCl
- Piranha
- Sonicator
- Filtered Water

Sonicator

Spin Coating

- Need even layer of Photoresist
- 1 micron (10^{-6} m) thick
- 3000 rpm for 30 sec
- Bake 30 min at 90°C

$$h = \frac{h_o}{\sqrt{1 + \frac{4\omega^2 \rho h_o^2 t}{3\eta}}}$$

$$r = r_o^{3/4} \sqrt[4]{1 + \frac{4\omega^2 \rho h_o^2 t}{3\eta}}$$

SpinCoater

Photoresist

- **PMMA:**
Poly**m**ethyl**m**eth**a**crylate
- Positive photoresist reacts with UV light to become soluble in developer
- Yellow Room

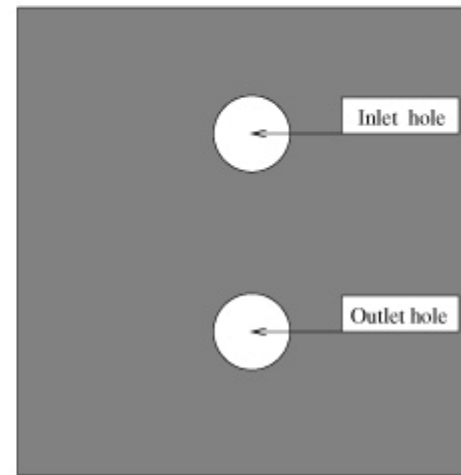

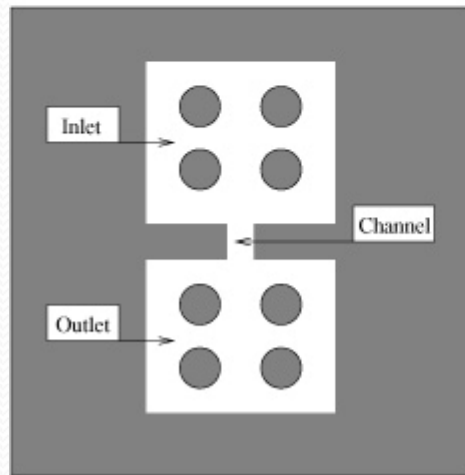

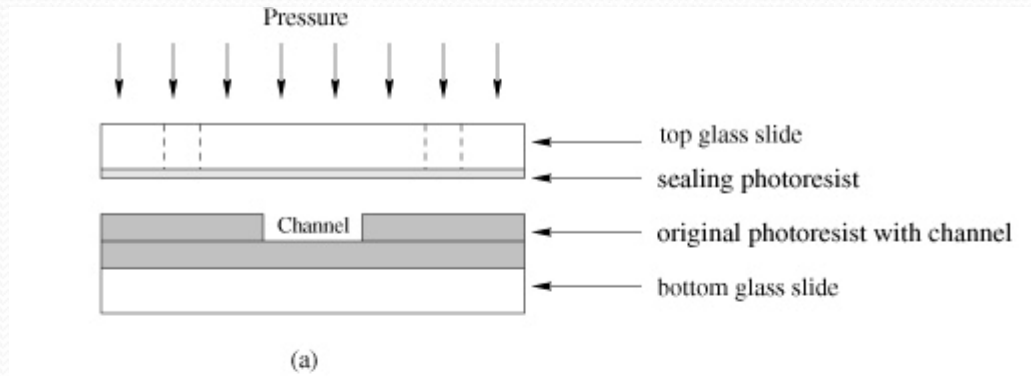

Exposures

Direct Exposure

Projection

Pore Structure

Data Collection

- Fill pores with wetting fluid, then Nitrogen
- Take CCD images during experiment
- Measure pressure
- Use IDL program to count pixels and find IAV and saturation

“Linking Pressure and Saturation Through Interfacial Areas in Porous Media”, Cheng et al, 2004

Experiment Setup

Running the Experiment

- Decane (wetting)
- Breakthrough
- Paths in the pattern
- Equilibrium

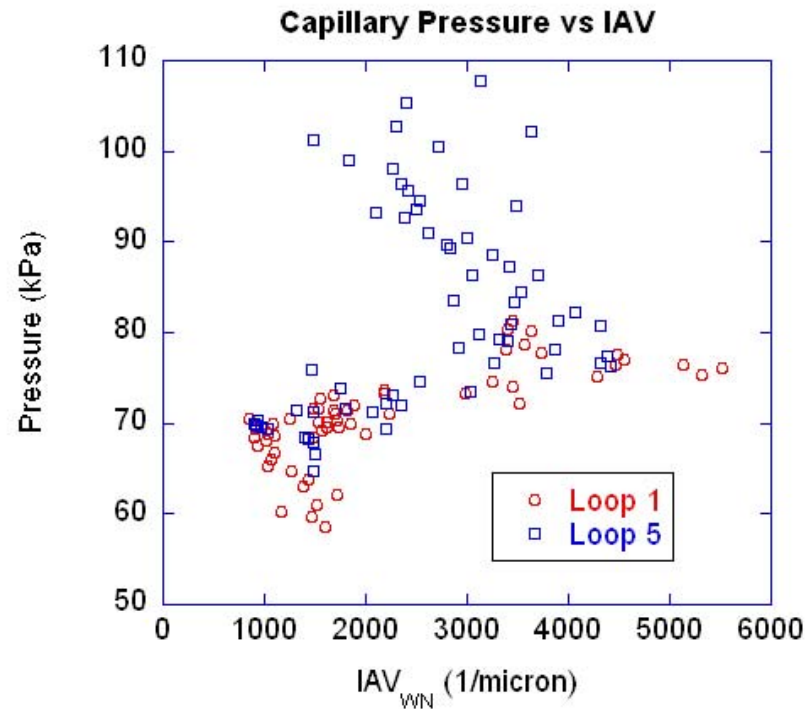

Troubleshooting

- Getting fluids into sample
- Decane gets into Nitrogen reservoir
- Bubbles can effect experiment
- Pattern not uniform-fingers
- Slides break easily
- Pressure control

Data Analysis

- IDL
- 2 Loops
- Thresholds
- Separate Phases
- Calculate IAV and saturation

- Wetting-Nonwetting
- Nonwetting-Solid
- ◇ Wetting-solid

Interfacial Area per Volume, Loop 1

- Wetting-Nonwetting
- Nonwetting-Solid
- ◇ Wetting-Solid

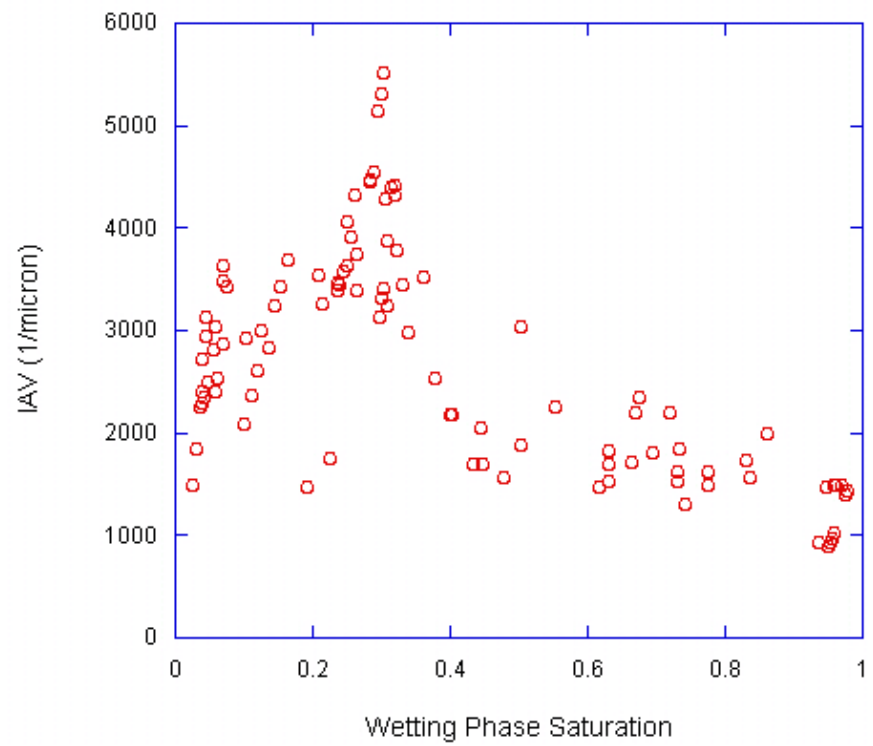

Interfacial Area per Volume, Loop 5

IAV vs Decane Saturation

Hysteresis Loops

Capillary Pressure vs. Decane Saturation

Future Experiments and Recommendations

- Try Olive Oil (surface tension= 40mN/m)
- New pattern
- Clean room
- New mask
- Syringe set-up
- Locking microscope stage
