

Quantum Hall Effect

Celia Burstein

June 26, 2012

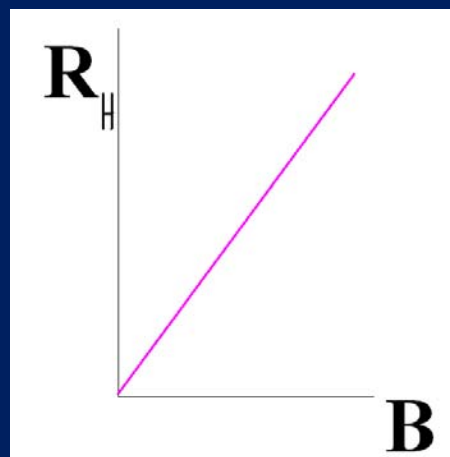

- 2D electron system \rightarrow Integer Quantum Hall Effect
- 2D electron system + electron interactions \rightarrow Fractional Quantum Hall Effect
- Disorder and Quantum Hall Effect

H. L. Stormer, Nobel Lecture, 1999

Hall Effect

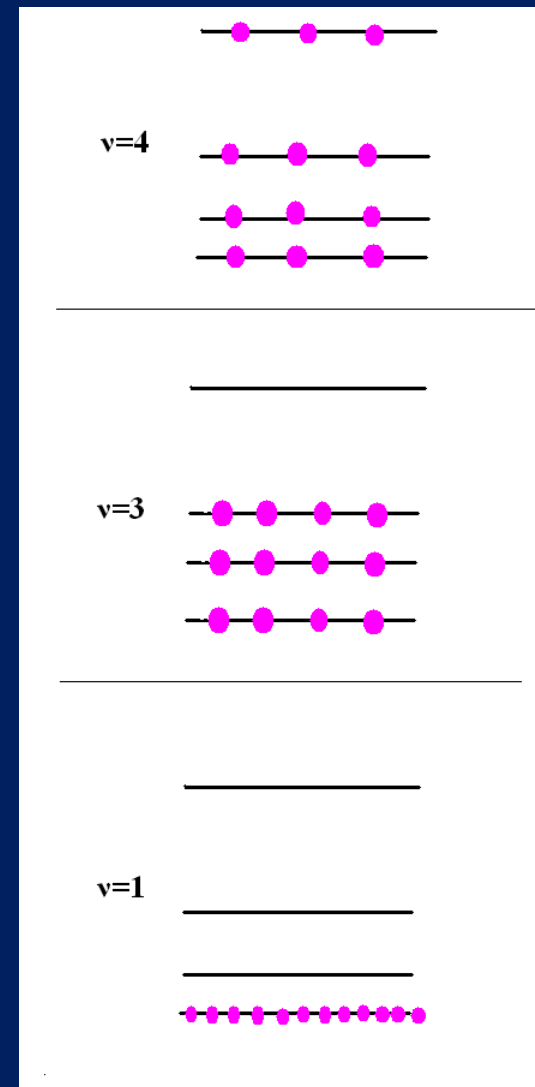

- V =voltage along current path
- V_H =voltage across current path
- V_H caused by Lorentz force
- R_{xx} and R_{xy}

H. L. Stormer, Nobel Lecture, 1999

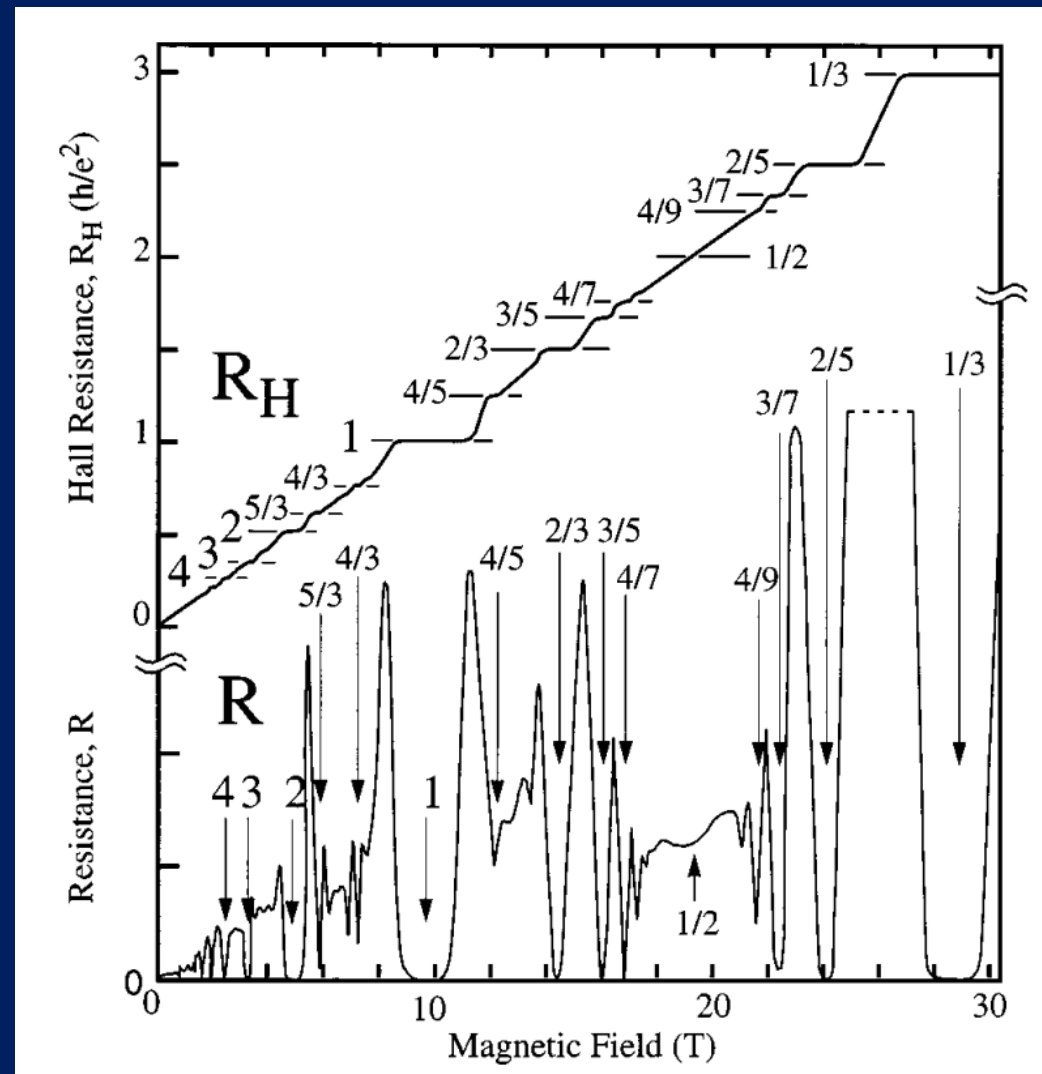

Quantization

- Energy of electrons is quantized in magnetic field
- Higher magnetic field:
 - Increase degeneracy
 - Lower filling factor, ν
- Magnetic Quantum Limit: $\nu=1$

Integer Quantum Hall Effect

- Can be described with single electron
- $\nu \geq 1$
- R_{xy} plateaus when R_{xx} minimizes

Hall Resistance

- Does not depend on length or area
- Depends on Fermi Energy Level
- Quantized when Fermi Energy Level lies within Landau level at edge states: $R_{XY} = h/(ie^2)$

2D Electron Gas (2DEG)

- Motion in third dimension fills energy gaps (IQHE is less dramatic)
- Molecular Beam Epitaxy to create GaAs/AlGaAs sandwich
- Modulation doping: Silicon is source of conduction electrons
- Low temperatures

Integrated Electron
Transport, 2011*

n-body Problems

- 2-body problems with classical mechanics
- 3-body problems with classical mechanics
- n-body problems with quantum mechanics

Robert B. Laughlin

Horst L. Störmer

Daniel C. Tsui

Fractional Quantum Hall Effect

- Many-particle effect in which Coulomb interactions play a role
- Flux Quanta attached to carriers to create composite particles
- Composite Fermions and non-Abelian states

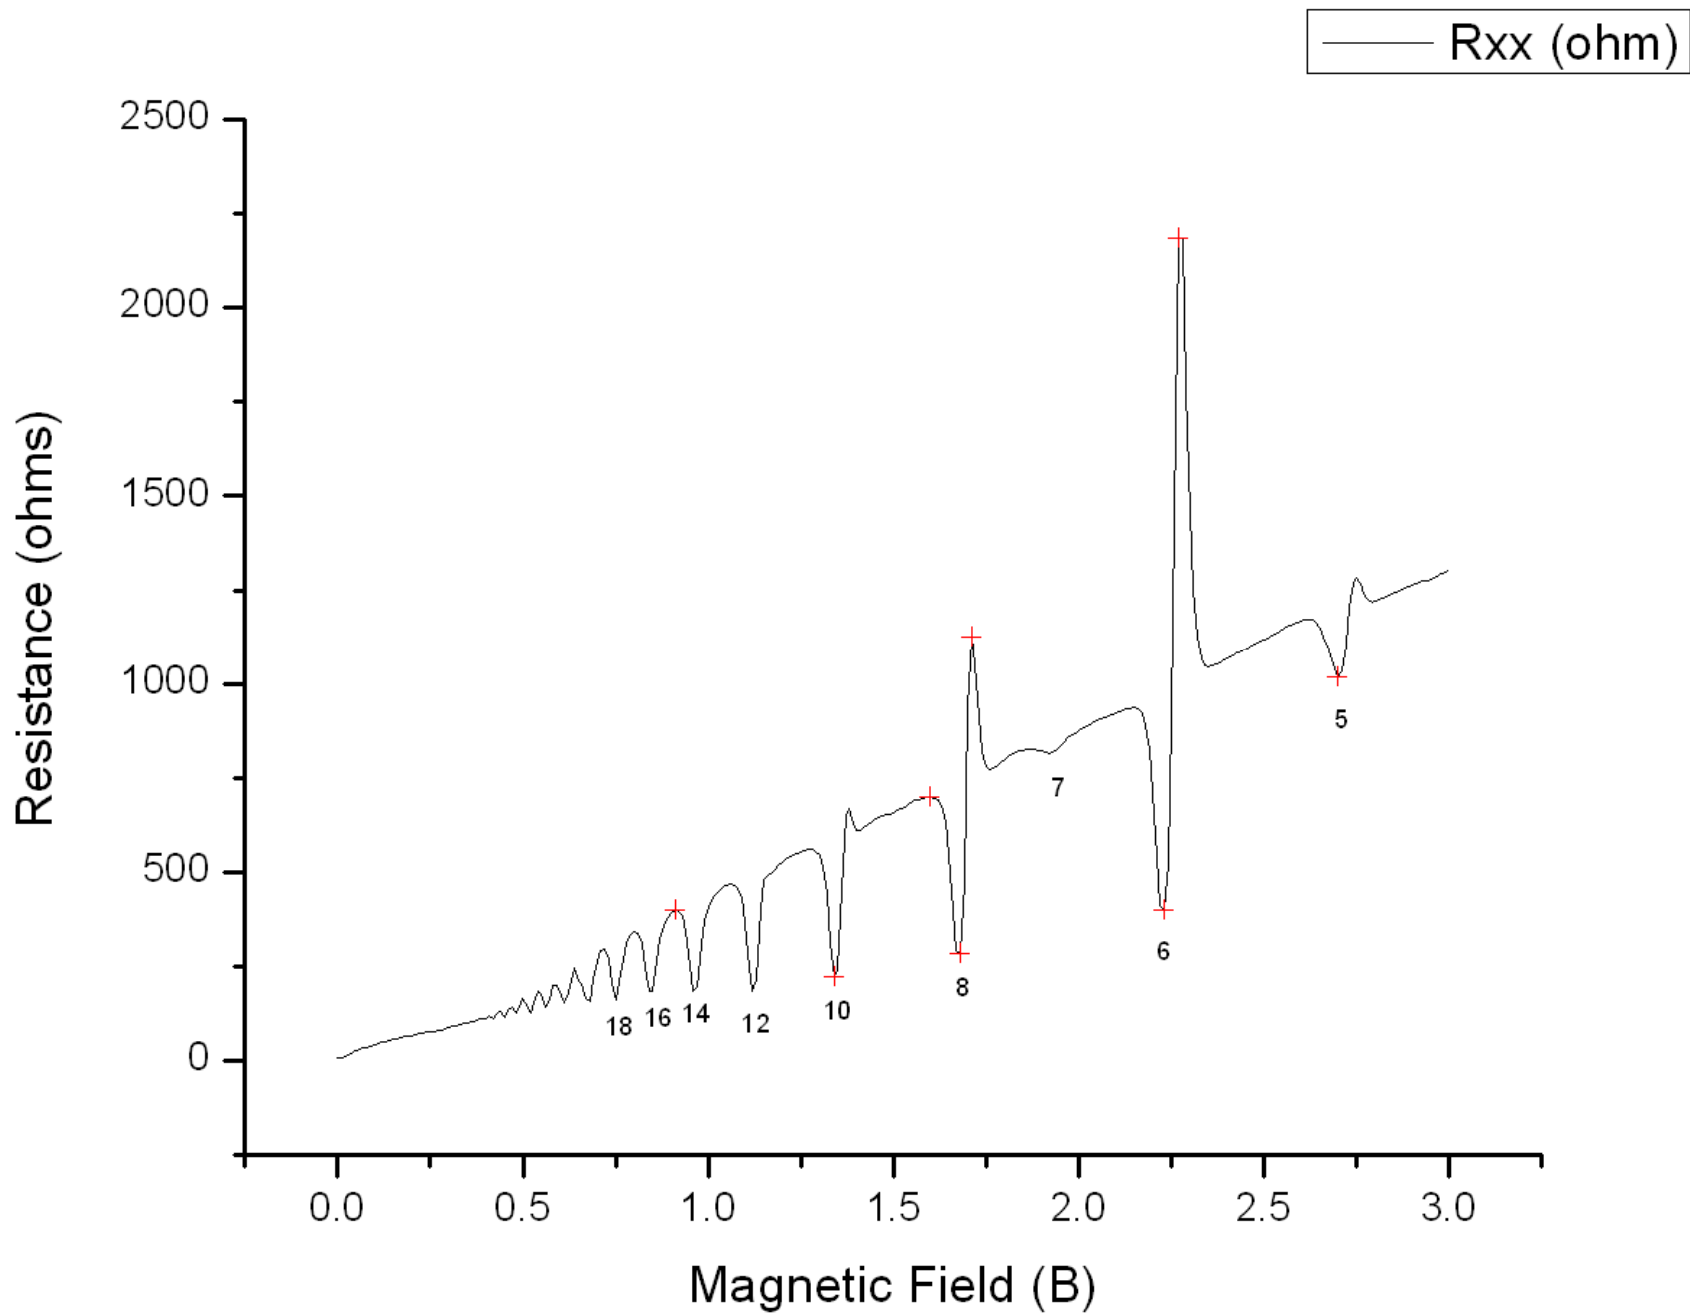

Resistance Measurement

- Use He Dewar to cool down AlGaAs/GaAs sample
- 4-probe measurement with lock-in amplifier
- Find correspondence between R_{xx} minima and states
- Determine density of electrons: $n = vBe/h$

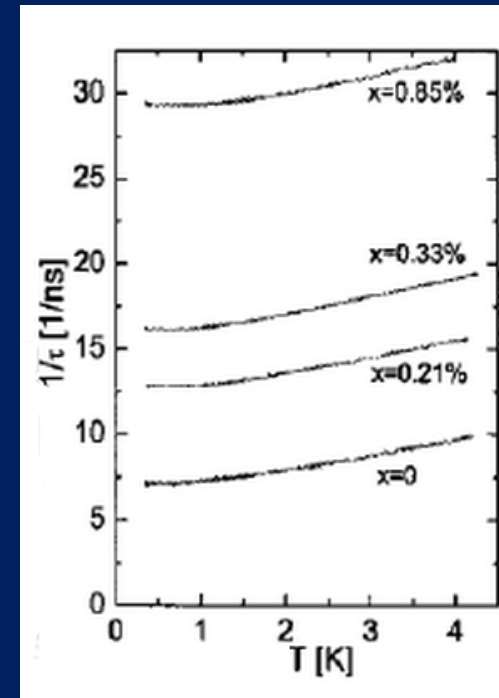

Disorder

- Neutral Disorder Source: Alloy scattering can be studied by adding small amount of Al impurities to GaAs
- Different states respond differently to same disorder
